## ABSTRACT OF THE DISCLOSURE

An analysis system that enables setting for a number of specific analysis procedures, and directly calls specific analysis procedures.

A configuration comprises analyzer software 4, job information 8 having information (such as user interface setting information 5 describing a customized state of a user interface such as menus and dialog boxes) allowing the analyzer software to adapt a specific analysis procedure, a job 3 linking the job information 8 and the analyzer software 4, job launching means 2 for launching a job, and job representing means 1 for representing a job.

The job representing means 1 is instructed by a user, and by combining the analyzer software 4 and the job information 8 related by the job 3 and launching, using the job launching means 2, it is possible to directly call specific analysis procedures.
